MyMathLab for Precalculus, 1e, by Schulz/Briggs/Cochran

$99.95 USD

Your Course

Math 106 WSU
Course ID: sveum04445
Taught by Stacey Sveum
Course ends Mar 13, 2015

Not your course? Enter a different course ID.

Waiting for financial aid? Get temporary access without payment for 14 days. Use an access code, credit card, or PayPal before September 6, 2014 to stay in your course.

Temporary access if you’re waiting for financial aid!

Note that this page shows a different course than ours. Pricing for Math 105 is approximately:

Textbook package at The Bookie - $118
MyMathLab only at the Bookie - $117
Textbook package at Crimson & Gray - $120
Enter your Access Code

The Access Code is included with your text.
Registration Complete

After your registration is complete, you see the confirmation page and get a confirmation email. You are ready to start working in your MyLab & Mastering course.

It may be helpful to know:

- Most MyMathLab homework questions will allow you three tries before you have to switch to a similar problem.
- After your three tries are up, you can click “Similar Exercise” at the bottom of the screen for a new try.
- You can do this as many times as you need until you have full credit for that question!
MyMathLab is

an online tutorial, homework, and adaptive assessment system for your mathematics courses.
Factor the following by grouping.

\[ a^2 - 4a + ab - 4b \]

\[ a^2 - 4a + ab - 4b = \square \] (Type your answer in factored form.)
Factor the following by grouping.

\[ a^2 - 4a + ab - 4b \]

\[ a^2 - 4a + ab - 4b = \Box \] (Type your answer in factored form.)
Factor the following by grouping.

\[ a^2 - 4a + ab - 4b \]

\[ a^2 - 4a + ab - 4b = (a-4)(a+1b) \] (Type your answer in factored form.)
Factor the following by grouping.

\[ a^2 - 4a + ab - 4b \]

\[ a^2 - 4a + ab - 4b = (a - 4)(a + b) \] (Type your answer in factored form.)

Well done!
6.1 The Greatest Common Factor; Factoring by Grouping

Objective: Factor by grouping.

Factor the following by grouping.

\[ a^2 - 4a + ab - 4b \]

\[ a^2 - 4a + ab - 4b = \square \] (Type your answer in factored form.)
Factor the following by grouping.

\[ a^2 - 4a + 2ab - 8b \]

\[ a^2 - 4a + 2ab - 8b = 3 \] (Type your answer in factored form.)

**Sorry, that's not correct.**

Collect the terms into two groups so that each group has a common factor. Factor out the greatest common factor from each group. Now, if each group has a common binomial factor, factor it out. If not, try a different grouping.
Factor the following by grouping.

\[ a^2 - 4a + 2ab - 8b \]

\[ a^2 - 4a + 2ab - 8b = (a - 4)(a + 2b) \] (Type your answer in factored form.)
