

Fast computation of the zeros of a polynomial

David S. Watkins

Department of Mathematics
Washington State University

Valencia, 2012

This is joint work with

- **Raf Vandebril** (KU Leuven)
- **Jared Aurentz** (WSU)

The Problem

- $p(x) = x^n - a_1x^{n-1} - a_2x^{n-2} - \dots - a_n = 0$
- Why on Earth?
- companion matrix

$$A = \begin{bmatrix} a_1 & a_2 & \cdots & a_n \\ 1 & & & \\ & 1 & & \\ & & \ddots & \\ & & & 1 & 0 \end{bmatrix}$$

- Get the zeros of p by computing the eigenvalues of A .

The Problem

- $p(x) = x^n - a_1x^{n-1} - a_2x^{n-2} - \dots - a_n = 0$
- Why on Earth?
- companion matrix

$$A = \begin{bmatrix} a_1 & a_2 & \cdots & a_n \\ 1 & & & \\ & 1 & & \\ & & \ddots & \\ & & & 1 & 0 \end{bmatrix}$$

- Get the zeros of p by computing the eigenvalues of A .

The Problem

Fiedler factorization (by Gaussian elimination)

$$\begin{bmatrix} a_1 & a_2 & a_3 & a_4 \\ 1 & & & \\ & 1 & & \\ & & 1 & 0 \end{bmatrix}$$

Fiedler factorization (by Gaussian elimination)

$$\begin{array}{l} \rightarrow \\ \rightarrow \end{array} \begin{bmatrix} a_1 & a_2 & a_3 & a_4 \\ 1 & & & \\ & 1 & & \\ & & 1 & 0 \end{bmatrix} = \begin{bmatrix} 1 & & & \\ a_1 & a_2 & a_3 & a_4 \\ & 1 & & \\ & & 1 & 0 \end{bmatrix}$$

Fiedler factorization (by Gaussian elimination)

$$\begin{array}{l} \rightarrow \\ \rightarrow \end{array} \begin{bmatrix} a_1 & a_2 & a_3 & a_4 \\ 1 & & & \\ & 1 & & \\ & & 1 & 0 \end{bmatrix} = \begin{bmatrix} 1 & & & \\ 0 & a_2 & a_3 & a_4 \\ & 1 & & \\ & & 1 & 0 \end{bmatrix}$$

Fiedler factorization (by Gaussian elimination)

$$\begin{array}{l} \left[\begin{array}{c} \rightarrow \\ \rightarrow \end{array} \right] \\ \left[\begin{array}{c} \rightarrow \\ \rightarrow \end{array} \right] \end{array} \begin{bmatrix} a_1 & a_2 & a_3 & a_4 \\ 1 & & & \\ & 1 & & \\ & & 1 & 0 \end{bmatrix} = \begin{bmatrix} 1 & & & \\ & 1 & & \\ & a_2 & a_3 & a_4 \\ & & 1 & 0 \end{bmatrix}$$

Fiedler factorization (by Gaussian elimination)

$$\begin{array}{l} \left[\begin{array}{c} \rightarrow \\ \rightarrow \end{array} \right] \\ \left[\begin{array}{c} \rightarrow \\ \rightarrow \end{array} \right] \end{array} \begin{bmatrix} a_1 & a_2 & a_3 & a_4 \\ 1 & & & \\ & 1 & & \\ & & 1 & 0 \end{bmatrix} = \begin{bmatrix} 1 & & & \\ & 1 & & \\ & 0 & a_3 & a_4 \\ & & 1 & 0 \end{bmatrix}$$

Fiedler factorization (by Gaussian elimination)

$$\begin{array}{c} \left[\begin{array}{c} \left[\begin{array}{c} \left[\begin{array}{c} \left[\begin{array}{c} a_1 \\ 1 \end{array} \right] \\ a_2 \\ a_3 \\ a_4 \end{array} \right] \\ 1 \\ 1 \\ 0 \end{array} \right] \\ \end{array} \right] \\ \end{array} \right] = \begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ & & & a_4 \end{bmatrix}$$

Fiedler factorization (by Gaussian elimination)

$$\begin{array}{c} \left[\begin{array}{c} \left[\begin{array}{c} \left[\begin{array}{c} \left[\begin{array}{c} a_1 \\ 1 \end{array} \right] \\ a_2 \\ a_3 \\ a_4 \end{array} \right] \\ 1 \\ 1 \\ 0 \end{array} \right] \\ \end{array} \right] \\ \end{array} \right] \\ \end{array} \right] = \begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ & & & a_4 \end{bmatrix}$$

Fiedler factorization (by Gaussian elimination)

$$\begin{array}{c} \left[\begin{array}{c} \rightarrow \\ \left[\begin{array}{c} \rightarrow \\ \left[\end{array} \right] \\ \left[\end{array} \right] \\ \left[\end{array} \right] \end{array} \right] \begin{bmatrix} a_1 & a_2 & a_3 & a_4 \\ 1 & & & \\ & 1 & & \\ & & 1 & 0 \end{bmatrix} = \begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ & & & 1 \end{bmatrix}$$

Fiedler factorization (by Gaussian elimination)

- Thus

$$\begin{bmatrix} a_1 & a_2 & a_3 & a_4 \\ 1 & & & \\ & 1 & & \\ & & 1 & 0 \end{bmatrix} = \begin{matrix} \left[\right] \\ \left[\right] \\ \left[\right] \end{matrix}$$

Fiedler factorization (by Gaussian elimination)

- Factors are

$$\begin{bmatrix} a_1 & 1 & & \\ 1 & 0 & & \\ & & 1 & \\ & & & 1 \end{bmatrix} \begin{bmatrix} 1 & & & \\ & a_2 & 1 & \\ & 1 & 0 & \\ & & & 1 \end{bmatrix} \begin{bmatrix} 1 & & & \\ & 1 & & \\ & & a_3 & a_4 \\ & & 1 & 0 \end{bmatrix}$$

- An $n \times n$ matrix has $n - 1$ factors.
- We will use this factored form.

Fiedler factorization (by Gaussian elimination)

- Factors are

$$\begin{bmatrix} a_1 & 1 & & \\ 1 & 0 & & \\ & & 1 & \\ & & & 1 \end{bmatrix} \begin{bmatrix} 1 & & & \\ & a_2 & 1 & \\ & 1 & 0 & \\ & & & 1 \end{bmatrix} \begin{bmatrix} 1 & & & \\ & 1 & & \\ & & a_3 & a_4 \\ & & 1 & 0 \end{bmatrix}$$

- An $n \times n$ matrix has $n - 1$ factors.
- We will use this factored form.

Fiedler factorization (by Gaussian elimination)

- Factors are

$$\begin{bmatrix} a_1 & 1 & & \\ 1 & 0 & & \\ & & 1 & \\ & & & 1 \end{bmatrix} \begin{bmatrix} 1 & & & \\ & a_2 & 1 & \\ & 1 & 0 & \\ & & & 1 \end{bmatrix} \begin{bmatrix} 1 & & & \\ & 1 & & \\ & & a_3 & a_4 \\ & & 1 & 0 \end{bmatrix}$$

- An $n \times n$ matrix has $n - 1$ factors.
- We will use this factored form.

A variety of orderings

- (works almost always)

$$\left. \begin{array}{l} \rightarrow \\ \leftarrow \end{array} \right\} \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ 0 & \times & \times \end{bmatrix}$$

Nonunitary Turnover Operation

- procedure with corrective Gauss transform
- (works almost always)

$$\begin{array}{l} \rightarrow \\ \leftarrow \end{array} \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ 0 & \times & \times \end{bmatrix}$$

- Option: do both at once.

Nonunitary Turnover Operation

$$\begin{array}{c} \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] = \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \times & \times & \times \end{bmatrix} = \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \end{array}$$

- yields a non-unitary variant of Francis's algorithm
- $O(n)$ space and $O(n^2)$ time
- it's pretty fast
- ... but we had a better idea.

Nonunitary Turnover Operation

$$\begin{array}{c} \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] = \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \times & \times & \times \end{bmatrix} = \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \end{array}$$

- yields a non-unitary variant of Francis's algorithm
- $O(n)$ space and $O(n^2)$ time
- it's pretty fast
- ... but we had a better idea.

Nonunitary Turnover Operation

$$\begin{array}{c} \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] = \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \times & \times & \times \end{bmatrix} = \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \end{array}$$

- yields a non-unitary variant of Francis's algorithm
- $O(n)$ space and $O(n^2)$ time
- it's pretty fast
- ... but we had a better idea.

Nonunitary Turnover Operation

$$\begin{array}{c} \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] = \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \times & \times & \times \end{bmatrix} = \begin{array}{c} \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \leftarrow \end{array} \right] \end{array}$$

- yields a non-unitary variant of Francis's algorithm
- $O(n)$ space and $O(n^2)$ time
- it's pretty fast
- ... but we had a better idea.

Nonunitary Turnover Operation

- yields a non-unitary variant of Francis's algorithm
- $O(n)$ space and $O(n^2)$ time
- it's pretty fast
- ... but we had a better idea.

Nonunitary Francis-like algorithm (second try)

Nonunitary Francis-like algorithm (second try)

- First transformation doesn't have to be unitary.
- Use a Gauss transformation instead.
- Gauss transform = unit lower triangular
- Thanks, Jared

Nonunitary Francis-like algorithm (second try)

- First transformation doesn't have to be unitary.
- Use a Gauss transformation instead.
- Gauss transform = unit lower triangular
- Thanks, Jared

Nonunitary Francis-like algorithm (second try)

- First transformation doesn't have to be unitary.

Nonunitary Francis-like algorithm (second try)

Nonunitary Francis-like algorithm (second try)

Nonunitary Francis-like algorithm (second try)

Nonunitary Francis-like algorithm (second try)

Nonunitary Francis-like algorithm (second try)

- Blue transform is a Gauss transform.

Nonunitary Francis-like algorithm (second try)

- Blue transform is a Gauss transform.
- Can we exploit this?

Nonunitary Francis-like algorithm (second try)

- Yes!

$$\begin{array}{c} \left[\begin{array}{c} \rightarrow \\ \rightarrow \\ \rightarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \rightarrow \\ \rightarrow \end{array} \right] = \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ 0 & \times & \times \end{bmatrix} \left[\begin{array}{c} \rightarrow \\ \rightarrow \\ \rightarrow \end{array} \right] = \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \times & \times & \times \end{bmatrix} \end{array}$$

- submatrix still has rank one!

Nonunitary Francis-like algorithm (second try)

- Yes!

$$\begin{array}{c} \left[\begin{array}{c} \rightarrow \\ \rightarrow \\ \rightarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \rightarrow \\ \rightarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \rightarrow \\ \rightarrow \end{array} \right] = \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \mathbf{0} & \times & \times \end{bmatrix} \left[\begin{array}{c} \rightarrow \\ \rightarrow \\ \rightarrow \end{array} \right] = \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \times & \times & \times \end{bmatrix} \end{array}$$

- submatrix still has rank one!

Nonunitary Francis-like algorithm (second try)

- Yes!

$$\begin{array}{c} \left[\begin{array}{c} \rightarrow \\ \rightarrow \\ \rightarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \rightarrow \\ \rightarrow \end{array} \right] \left[\begin{array}{c} \rightarrow \\ \rightarrow \\ \rightarrow \end{array} \right] = \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \mathbf{0} & \times & \times \end{bmatrix} \left[\begin{array}{c} \rightarrow \\ \rightarrow \\ \rightarrow \end{array} \right] = \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \times & \times & \times \end{bmatrix} \end{array}$$

- submatrix still has rank one!

Nonunitary Francis-like algorithm (second try)

- So ...

$$\begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \times & \times & \times \end{bmatrix} = \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ 0 & \times & \times \end{bmatrix} = \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \times & \times & \times \end{bmatrix}$$

- (Blue) Gauss transform does not disturb 2×2 submatrix.

Nonunitary Francis-like algorithm (second try)

- So ...

$$\begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \times & \times & \times \end{bmatrix} = \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \mathbf{0} & \times & \times \end{bmatrix} = \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \times & \times & \times \end{bmatrix}$$

- (Blue) Gauss transform does not disturb 2×2 submatrix.

Nonunitary Francis-like algorithm (second try)

- So ...

$$\begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \times & \times & \times \end{bmatrix} = \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \times & \mathbf{0} & \times \end{bmatrix} = \begin{bmatrix} \times & \times & \times \\ \times & \times & \times \\ \times & \times & \times \end{bmatrix}$$

- (Blue) Gauss transform does not disturb 2×2 submatrix.

Nonunitary Francis-like algorithm (second try)

Nonunitary Francis-like algorithm (second try)

- ... and so on.
- This is much faster!
- It is a structured, implicitly-shifted LR algorithm.

Nonunitary Francis-like algorithm (second try)

- ... and so on.
- This is much faster!
- It is a structured, implicitly-shifted LR algorithm.

Nonunitary Francis-like algorithm (second try)

- ... and so on.
- This is much faster!
- It is a structured, implicitly-shifted LR algorithm.

Contestants

- LAPACK code ZHSEQR ($O(n^3)$)
- BBEGG (fast, unitary, one of the better codes)
- AVW1 (our first attempt)
- AVW2 (our second attempt)

Speed Comparison

No crossover point!

Speed Comparison

No crossover point!

Speed Comparison

- At $n = 1200$:

| method | time |
|--------|------|
| LAPACK | 32.7 |
| BBEGG | 6.5 |
| AVW1 | 2.6 |
| AVW2 | 0.6 |

Final Words

- Our code is lightning fast, but ...
- how robust is it?
- Answer: Not as robust as we'd like.
- We can't recommend it for general use, but ...
- it must be good for something.
- (good initial guesses for almost free)

Final Words

- Our code is lightning fast, but ...
- how robust is it?
- Answer: Not as robust as we'd like.
